

# Stabilized Construction Entrance

## *The Good.....*

Properly sized entrance and stone. The size of the construction entrance should be based on the type of construction activity.

## *The Bad.....*

Stabilized construction entrance is too small with the wrong size stone.

Wrong size stone for the stabilized entrance which results in additional street sweeping. In addition, this size stone stuck in muddy tires can become projectiles when driving at higher speeds.

## *And the Ugly.....*

Single family homes must have stabilized entrances as well.

Equipment should not be allowed to hop curbs to access a lot. This can damage the curb plus increase street sweeping costs.

All points where construction equipment must have a stabilized construction Entrance.
